Title: Components of Tomorrows PDS
Topic (Session): Future Directions in Data Management

Abstract of Presentation:

The architecture of the Planetary Data System (PDS) is evolving to
handle growing data volume and an increasingly networked community of
data providers and users. New components are required that provide
better data access, automated ingestion of new data, and distribution
of customized data collections. This paper describes components of the
next generation PDS. It explores the function of each component and
how the components interact. Finally, it is shown how components are
tied together through the PDS metadata model.
